ANALYZE WEB SERVERS USING WEBALIZER TOOL

AIM:

To analyze web server logs and obtain usage statistics using the Webalizer tool in Fedora.

ALGORITHM:

1. Install the Apache web server.
2. Start and enable the Apache service.
3. Locate the web server access log file.
4. Install the Webalizer tool.
5. Create a directory to store the Webalizer reports.
6. Run Webalizer using the server access log file.
7. Generate the web server usage report.
8. Open the generated report in a web browser.
9. Analyze the statistics, including hits, visits, pages, URLs, and data transferred.

PROGRAM / COMMANDS:

Step 1: Install Apache web server.

sudo dnf install httpd

Step 2: Start the Apache service.

sudo systemctl start httpd

Step 3: Enable Apache to start automatically.

sudo systemctl enable httpd

Step 4: Install Webalizer.

sudo dnf install webalizer

Step 5: Create a directory to store the reports.

sudo mkdir -p /var/www/html/webalizer

Step 6: Generate the report using the Apache access log.

sudo webalizer -o /var/www/html/webalizer /var/log/httpd/access_log

Step 7: Open the report in a web browser.

http://localhost/webalizer/

PROCEDURE:

1. Open the Fedora terminal.
2. Install Apache using the given command.
3. Start and enable the Apache service.
4. Install Webalizer using the package manager.
5. Create the directory for storing the reports.
6. Execute the Webalizer command with the Apache access log file.
7. Open a web browser and enter http://localhost/webalizer/.
8. View and analyze the generated web server statistics.

OUTPUT:

Webalizer generates a report containing web server usage statistics, such as:

1. Total number of hits.
2. Number of visits.
3. Number of pages requested.
4. Frequently accessed URLs.
5. Amount of data transferred.
6. Web server usage summaries.

RESULT:

Thus, the Webalizer tool was used to analyze web server logs and generate usage statistics, including hits, visits, pages, URLs, and data transferred.
